Introduction :

This Custom Firmware by Darkside et Zer01ne, member of the Black devs team .

The first build of custom firmware FE started since 9 months .

Now this is the 7 version of this Firmware, and it provides a lot of news .

I said that the custom firmware is no longer the FE but the BDT version .

What's this :

This firmware was designed to improve Time Machine (other words for those who have a PSP SLIM and can not benefit Kernel 1.50) .

We therefore believe that who are the PSP SLIM should install this firmware that could be more than beneficial.

What are it's features :

The features of this Firmware are :

- **Recovery mod** : Can set the firmware, pressing on RTRIGGER when the psp start, .
- **VSH MENU FE** : To access in news of your PSP, pressing on RTRIGGER ET LTRIGGER .
- **Protect FE** : Enabled by the configuration file, lets start your PSP to be controlled by a password. .
- **UMDCTRL** : To UMD launching requiring higher Firmware of 1.50, just by pressing LTRIGGER + HOME.
-
- **FE SNAP** : To take screenshot in VSH or GAME, pressing on []+RTRIGGER

How to install :

You must first set up Time Machine by 1.50 (SLIM) With 340 Module, and then start over,
Then go in the menu of your PSP games and run:

Follow the instructions displayed on the screen .
